

Eastern Mediterranean Oil Study

Regional Petroleum Geochemistry of Crude Oils
from the Eastern Mediterranean

GeoMark Research has completed a regional evaluation of crude oil from basins surrounding the eastern Mediterranean. This study characterizes these oil samples and describes their organofacies and maturity for correlation to known source rocks. This work is presented to reduce risk and narrow the uncertainty associated with exploration activities within this high potential area. This study consists of detailed geochemical analysis of 108 produced oil samples, including quantitative biomarkers (terpanes and steranes), saturate and aromatic carbon isotopes, and gas chromatography.

Key observations from this analysis include:

- Discussion and identification of key risks associated with source presence, effectiveness, and charge.
- Maps of oil family distribution, based on organofacies and maturity analysis.
- Oil and source correlation criteria for source extent and effectiveness and advanced fluid quality prediction.

The purchase price includes a perpetual license to all study documents and a 3-year subscription to the data. This study is available for immediate delivery.

Well Count: 88
Oil Samples: 108
