

## Gulf of Mexico Gas Study

Regional Petroleum System Study of Production Gas Samples from the Gulf of Mexico

GeoMark Research, Inc. has completed a Gulf of Mexico Gas Study (**GOMGAS™**) to complement its existing Gulf of Mexico Oil Study (**GOMOIL™**). Virtually all samples have both compositional and stable carbon isotope measurements which is critical for determining the percentage of biogenic gas in a reservoir and for estimating the maturity and age of the thermal gas component (Tertiary, Cretaceous, or Jurassic). The study is designed to:

- Expand the understanding of the source origins and maturity of natural gas within the Gulf,
- Assist exploration and exploitation efforts related to associated gas issues, and
- Investigate the regional importance/implications of biogenic and mixed gases.

The results of the Study are provided in a detailed interpretive written report and an ArcMap™ project. The purchase price includes a perpetual license to all study documents and a 3-year subscription to the associated data. This study is available for immediate delivery.
