

Southern Europe Oil Study

Regional Petroleum Geochemistry of Crude Oils from Southern Europe, Eastern Turkey and Northeast Syria

GeoMark Research has completed a regional evaluation of crude oil from the sedimentary basins of Southern Europe including Portugal, Spain, Sicily, Bosnia & Herzegovina, Montenegro, Turkey, and Syria. The purpose of this study is to characterize the oil samples for organofacies and maturity and correlate them to known source rocks. This work is presented to reduce the risk and narrow the uncertainty associated with exploration activities throughout the region.

This study consists of 96 produced oil samples completed for detailed geochemical analysis of quantitative biomarkers (terpanes and steranes), saturate and aromatic carbon isotopes, and gas chromatography.

Key observations from this analysis include:

- Discussion and identification of key risks associated with source presence, effectiveness, and charge.
- Maps of oil family distribution, based on organofacies and maturity analysis.
- Oil and source correlation criteria for source extent and effectiveness.

The purchase price includes a perpetual license to all study documents and a 3-year subscription to the raw dataset. This study is available for immediate delivery.

Well Count: 90
Oil Samples: 96
