

Oriente Oil Study

REGIONAL PETROLEUM GEOCHEMISTRY OF CRUDE OILS FROM THE ORIENTE, PUTUMAYO, AND MARAÑON BASINS

GeoMark Research has completed an extensive analysis of the petroleum systems of the Putumayo, Napo, Marañon and Santiago Basins. The study involved the detailed analysis of 184 crude oil samples collected from most fields and all productive stratigraphic horizons.

The results successfully identify both geographically and strati-graphically separated oil families, and conclusively explains much about the source and migration history of the basins. The study serves as an excellent tool for assessing the amount and type of hydrocarbon that can be expected from unexplored regions, and will be of particular value for companies exploring in the foot-hill region.

Samples: The geographic distribution of the samples is as follows:

Putumayo Basin	21 Samples
Napo Basin	114 Samples
Marañon Basin	45 Samples
Santiago Basin	4 Samples

Timing: The study is complete and available for immediate delivery

Price: The cost of the study is (US) \$37,500.
