GeoMark Research is offering a regional assessment of the resource potential of the Lower Cretaceous Sunniland Formation of south Florida. This study combines both source rock and detailed oil analyses to evaluate and map the source potential for this play and concludes with an estimation of generated oil and gas. In its entirety, the study involves the source rock analysis of over 120 samples from 9 individual wells, and the detailed analysis of 6 oil samples that have been sourced by the Sunniland Formation.

This study evaluates the Sunniland Resource Play and map qualified “sweet spots” within the trend. Key geochemical parameters were mapped and then graphically integrated with the oil data, confirming the results of the source rock interpretation. A final report will be provided summarizing interpretations and conclusions resulting from mapping and analysis of the combined data sets.

**Samples:** This study draws on the analyses of over 120 samples from 9 individual wells, and the detailed analysis of 6 oil samples that have been sourced by the Sunniland Formation.

**Timing:** The study is complete and available for immediate delivery

**Price:** The cost of the study is (US) $21,000.
